# **SIGNIFICANT NATURAL HERITAGE AREAS**

February 2009

## **Introduction**

The North Carolina Natural Heritage Program compiles the N.C. Department of Environment and Natural Resources' list of significant "Natural Heritage Areas" as required by the Nature Preserves Act (NCGS Chapter 113A-164 of Article 9A). The list is based on the program's inventory of the natural diversity in the state. Natural areas (sites) are evaluated on the basis of the occurrences of rare plant and animal species, rare or high quality natural communities and special animal habitats. The global and statewide rarity of these elements and the quality of their occurrence at a site relative to other occurrences determine a site's significance rating. The sites included on this list are the best representatives known of the natural diversity of the state and therefore deserve priority for protection. Inclusion on this list does not directly confer protection to a site, however, the ecological significance of a site may be taken into consideration by state or federal agencies as part of their normal operations. The list includes both protected and unprotected areas. Inclusion on this list does not mean that public access exists or is appropriate. Permission of the land owner is needed for all lands not open to the public. This list of sites and their significance ratings is based on the best available information, as derived from the Natural Heritage Program databases. This list updates the set of known significant areas and their significance ratings, reflecting changes since the last list was published in 2008. Not all sites have been visited in this time period, and some of the ratings are based on older data. It is possible that some sites have been damaged or destroyed since they were last visited. More information on these natural areas may be obtained from the Natural Heritage Program.

## **Natural Area Significance**

Natural areas are rated for their significance to protection of biodiversity. Because biodiversity depends on the conservation of a large number of different species and community types, with distinctive habitats, simple measures based on number of rare elements in a site are not sufficient. The most significant sites are those that make up a balanced set containing the best sites for all elements. Large sites with many rare species and communities are very significant, but some sites with only a single rare species may also be highly significant to biodiversity. Some species and community types do not occur in any large or rich sites, and can only be conserved in sites without other species or communities. North Carolina's natural areas are rated based on the value of the element occurrences – rare species and high quality natural communities – that they contain. Their significance is rated based on comparison with other sites for those same elements.

### Natural Area Significance (Signif.)

- A = Nationally significant natural areas contain examples of natural communities, rare plant or animal populations, or geologic features that are among the highest quality, most viable, or best of their kind in the nation, or clusters of such elements that are among the best in the nation.
- B = Statewide significant natural areas contain similar ecological resources that are among the best occurrences in North Carolina. There are a few better quality representatives or larger populations on nationally significant sites elsewhere in the nation or possibly within the state.
- C = Regionally significant natural areas contain natural elements that may be represented elsewhere in the state by better quality examples, but which are among the outstanding examples in their geographic region of the state. A few better examples may occur in nationally or state significant natural areas. Regions consist of an area the size of about five counties.

### **Site Scale and Nesting**

Frequently, related natural areas occur in clusters. The occurrence of a natural area in association with other natural areas increases its long-term viability and ecological significance. Where multiple natural areas occur in a cluster that shares ecological function, the complex and the associated lands are designated as a macrosite. When one or more macrosites and other smaller natural areas occur in association, it may be designated as a megasite. Macrosites and megasites thus not only contain smaller significant natural areas, but they may also contain lands which normally would not be included in a natural area but which are important for consolidating and connecting the cluster.

Natural areas that are not designated as macrosites or megasites are known as standard sites. In fact, the great majority of the natural areas in this listing are standard sites. In many cases, standard sites do not occur in clusters with other natural areas (i.e., in macrosites or megasites). These standard sites are referred to as "stand-alone" sites.

Sizes of natural areas differ greatly. A site may encompass thousands of acres that support many exceptional natural resources and special-interest species, and be logically considered a single large composite natural area. In a few cases, a site may be restricted to a few acres containing a remnant population of an endangered species or other unique feature that does not occur in any larger sites. Megasites and macrosites are always large, but some stand-alone sites are also very large contiguous natural areas.

The significance categories and definitions listed above are applied to standard sites of all sizes, and also to macrosites and megasites.

## Organization of the List

### Natural Area Name

The following list of North Carolina's most significant natural areas (standard sites, macrosites, and megasites) is organized by county, and the natural areas within each county are ordered by ratings of national, statewide, or regional (greater than county) significance. This list includes all known areas of National, Statewide, and Regional significance. It does not include natural areas considered to be of only county or local importance, though such areas are inventoried and tracked by the Natural Heritage Program.

Standard sites which occur within megasites or macrosites are grouped in this list under the name of the larger natural areas. The nesting of a standard site within a megasite or a macrosite is indicated by a vertical gray bar to the left of the name. A thick gray bar indicates a standard site that is nested within both a macrosite and a megasite; in such cases, the macrosite that contains these sites also has a thick gray bar to the left of the name. Macrosites that are not nested within a megasite have only a thin gray bar, as do the standard sites within that macrosite. A natural area (standard site) with no gray bar to the left of the name is a stand-alone site.

### USGS Quads

The name(s) of the USGS 7.5-minute quadrangle on which a natural area lies is given in the second column. (Quads are not given for megasites and macrosites.)

### Signif.

See "Natural Area Signif." at the top of page ii.

### Owner

The fourth column indicates ownership of the natural area. See the following Owner abbreviations. A few of these Owner Codes are found on the natural area list only in the Comments field; such entities hold easements or agreements but are not owners of tracts.

Owner Code	Owner
AFT	AMERICAN FARMLAND TRUST

Comments

The fifth column provides some information on the current protection status of a natural area. Where appropriate, comments about the status of the natural area or the protection needs are also given. Tracts protected by a Conservation Easement are listed as "EASEMENT"; no Protection Code acronym is listed.

Protection Code	Protection Designation
